A VITAL PROCESS FOR ADDRESSING
GLOBAL FOREST CHALLENGES
THE MONTREAL PROCESS

This report highlights how the Montreal Process has played a role in helping member countries respond to the challenges and opportunities for our forests from four global issues.

These issues are climate change, biodiversity, and more, all of which are critical to present and future generations. Forests play an important and multi-faceted role in these issues as a source of carbon sinks, the hosts of many species, and a primary source of fresh water and food. Solutions to the challenges posed by these issues therefore require concerted and collaborative actions needed by sustainable forest management at international, national, and operational levels.
